

## COM/CSC 271 Assignment

# Events

### A. Describe Your Event

Write a short paragraph that describes an event-handling process you plan to implement on your product website.

On my product website, I will implement an event-handling process that shows a preview of a user's uploaded target image when they hover over one of their logged shooting sessions. The interactive element will be the session row itself, which the user moves their mouse over. A mouseover event will trigger a function that selects the hidden image preview container and makes it visible next to the row. When the user moves their mouse away, a mouseout event will fire and the script will hide the preview again. This creates a clear and helpful interaction that lets users quickly see their uploaded target image without needing to open the full overview page.

### B. Draw an Event Handling Flowchart

Create a flowchart that visually represents your event-handling process. Use the examples above as a reference.
